4. INTRODUCTION AND SCOPE

This document provides the information needed to work with BIBLOS. A guide is provided to get started with BIBLOS, how to use it with existing software, or how to create new software units for BIBLOS.

In detail, the scope of this document is:

- In this document presented is the architecture of the Block (see 6.1) and Module (see 6.2) as well as helper classes for Module/Block parameter mapping (see 7.1.1) and parsing configuration files (see 7.1.2).
- Chapter 7. presents the quick tutorial on how to create a new block or a new module.
- For general installation guidelines and installation requirements please refer to chapter 8..
- Chapter 9. presents Biblos blocks and modules : the input and output arguments to the compiled binaries, installation, test and run example commands.
- For step-by-step installation guide for Biblos COTS and all Biblos libraries package, as well as openSF integration, please refer to chapter 10.

5. REFERENCES

5.1. REFERENCE DOCUMENTS

The following documents, although not part of this document, amplify or clarify its contents. Reference documents are those not applicable and referenced within this document. They are referenced in this document in the form [RD.X]:

Table 5-2: Project documents

6. DESIGN

This chapter describes the Biblos abstraction layer that the user should be aware about when designing or modifying blocks and/or modules.

6.1. BLOCK ABSTRACT CLASS TEMPLATE

Biblos.Block is an C++ abstract class template, which is a common base class for each block. First of all, Block provides the functions that are useful in implementing derived classes, such as helper functions and structure for mapping input parameters identifiers based on the order to their names. Block also declares the functions that need to be implemented by derived classes so the block could be executed in a module.

Block abstract class template referred to as Biblos.Block is available in Biblos.Commons.

6.1.1. DESCRIPTION

This is a common base class for Biblos blocks. All blocks that user want to execute within a module should inherit from Biblos.Block.

6.1.2. TEMPLATE ARGUMENTS

Declaration of Biblos.Block:

template<typename GlobalConfigType, typename LocalConfigType> class Block;

Template arguments are:

- Type of global configuration file
- Type of local configuration file

Global configuration file structure should implement:

Function: *static void read(const std::string &filename, B_GlobalConfigType & config, const std::string &line);*

This function parses configuration file and fills config structure

Function: *void log()const;*

This function uses Logger from EOCFI Libraries to log configuration parameters

Local configuration file structure should implement:

Function: *static void read(const std::string &filename, B_LocalConfigType & config, const std::string &line);*

This function parses configuration file and fills config structure

Function: *void log()const;*

This function uses Logger from EOCFI Libraries to log configuration parameters

6.1.3. CONSTRUCTOR ARGUMENTS

Block(ParameterIOFileIds && ios)

A pair of vectors. First of them is a vector of input file identifiers. Second is a vector of output file identifiers. Identifier type is: std::string.

6.1.4. FUNCTIONS TO IMPLEMENT

Function: *B_execute*

*virtual int B_execute(const GlobalConfigType &global_param, const LocalConfigType &local_param,
 const std::vector<std::string> & input, const std::vector<std::string> &output) = 0;*

This is a function that executes block.

Parameters are:

global_param – global configuration file

local_param – local configuration file

input – a vector of block input file names

output – a vector of block output file names

The function process one detector line.

Function: `virtual std::map<DetectorLineID, std::pair<GlobalConfigType, LocalConfigType>> parseConfigurationFiles (const std::string &globalConfigurationFilename, const std::string &localConfigurationFilename) const = 0;`

This is a function that parses configuration files.

Arguments are:

`globalConfigurationFilename` – global configuration file name

`localConfigurationFilename` – local configuration file name

Return value:

Map with the mapping of particular detector line identifier to its configuration – the global and the local one.

6.2. MODULE CLASS TEMPLATE

6.2.1. PACKAGE

Module abstract class template referred to as `Biblos.Module` is available in `Biblos.Commons` package.

6.2.2. DESCRIPTION

This is a common base class for Biblos modules. Module variadic template (a template with take a variable number of arguments) inherits from all the blocks that specialize that template. Object of a specialized module template is able to execute it's blocks for all detector lines.

6.2.3. TEMPLATE ARGUMENTS

Declaration of the module:

`template<typename ... Args> class Module;`

Template arguments are assumed to be of type : `Block`

6.2.4. PUBLIC MEMBERS

Function : `int execute(const std::vector<std::string> &moduleInput, const std::vector<std::string> &moduleOutput, const std::string &globalConfigFilename, const std::string &localConfigFilename);`

The function execute module blocks for all detector lines.

Arguments:

`moduleInput` – module input data filenames

`moduleOutput` – module output data filenames

`globalConfigFilename` – a global configuration file name

`localConfigFilename` – a local configuration file name

Module maps module input and output data filenames to block input and output filenames. For example:

The input to the Resampling block is : `reference_image_filename, geodetic_filename`

The input to the Atmosphere block is : `LUT_folder_path, sza_filename, oza_filename, raa_filename, geodetic_filename`

The result of the mapping – the input to the module is:

`Reference_image_filename, geodegic_filename, LUTS_folder_path, sza_filename, oza_filename, raa_filename.`

Note that `geodetic_filename` has only one occurrence in input module file names. The mapping is module/blocks independent. Requirement for the blocks to use the same file id to map it to correct input/output filename.

Function : *const IParamMapperBlock &getParamMapperBlock()const;*

The function returns parameter mapper interface of type IparamMapperBlock. Important public members are:

printParams() : prints registered parameters identifiers for the module

getInputParamsNum() : returns registered input parameters number for the module

getOutputParamsNum() : returns registered output parameters number for the module

7. CREATING BLOCKS AND MODULES

This section presents to the user what is required to create a block.

7.1. CREATING NEW BLOCK

New block should inherit from Biblos.Block. It has to implement it's virtual functions (see 6.1.4). As an example the Biblos.Orbit block is presented:

```
namespace biblos{namespace geometry{
class B_Orbit : public biblos::Block<B_OrbitGlobalConfig, B_OrbitLocalConfig>
{
public:
    B_Orbit()
        : Block(std::make_pair(std::vector<std::string>({GeomFilenamesIds::iers_eop_time_init,
GeomFilenamesIds::ini_state_vector}), 
        std::vector<std::string>({GeomFilenamesIds::real_orbit,
GeomFilenamesIds::estimated_orbit})))
    {
    }
    virtual ~B_Orbit(){}; 
    int B_execute(const B_OrbitGlobalConfig &global_param, const B_OrbitLocalConfig &geom_param,
        const std::vector<std::string> &inputFiles,
        const std::vector<std::string> &outputFiles) override;

    std::map<DetectorLineID, std::pair<B_OrbitGlobalConfig, B_OrbitLocalConfig>>
parseConfigurationFiles(
        const std::string &globalConfigurationFilename, const std::string &
localConfigurationFilename) const override;
private:
    Logger B_Log;
};}}
```

The Orbit.Block implements the methods listed in 6.1.4. As a helper structure for file identifiers the Biblos.Orbit uses GeomFilenamesIds enumeration.

7.1.1. GETTING ARGUMENTS FROM INPUT/OUTPUT VECTOR

Input/output vector contains input and output data filenames. To get particular file using this file id passed to Block constructor, the user may use the following:

```
std::string iersFilename = inputFiles[
this->getRegisteredParamId(GeomFilenamesIds::iers_eop_time_init)
];
```

Function *getRegisteredParamId* provided by Biblos.Block allows the user to obtain file identification number in the vector using file identifier (here *GeomFilenamesIds::iers_eop_time_init*).

7.1.2. PARSING CONFIGURATION FILES

For configuration files parsing the user may use helper functions implemented in *PropertyTreeHelper* class located in Biblos.Commons package. As an example Orbit block function for global configuration file parsing is presented:

```
void B_OrbitGlobalConfig::read(const std::string &filename, B_OrbitGlobalConfig & config, const std::string &line)
{
    PropertyTreeHelper reader(filename);
    const auto & rootNode = reader.root();
    const auto & lineNode = reader.findParameterParentTree<std::string>(rootNode, "Detector_ID", line);
    config.detector_id = line;
    config.debug_mode = ReaderUtils::getDebugMode();
    config.instrument_sampling_time = reader.getParameterValue<double>(lineNode, "instrument_sampling_time");
    config.output_square_size = reader.getParameterValue<unsigned int>(lineNode, "output_square_size");
    config.satellite_position_attitude_sampling_time = reader.getParameterValue<double>(rootNode, "satellite_position_attitude_sampling_time");
}
```

7.2. CREATING NEW MODULE (CONNECTING BLOCKS)

Each module should specialize Module template (see. 6.2). As an example SceneGeneration module implementation is presented:

```
Module<B_Resampling, B_AtmosphereSimulatorMain> sceneGeneration;
int code = sceneGeneration.execute(moduleInput, moduleOutput, globalFilename_, localFilename_);
return code;
```

The one requirement is that template arguments (blocks) should inherit from Biblos.Block (see 6.1)

8. INSTALLATION GUIDELINES

This chapter presents Biblos installation guidelines: environment requirements that are common for all the blocks and modules as well as additional requirements for particular modules. For example installation commands for each package please refer to 9. , for step-by-step guide refer to 10.

8.1. SYSTEM REQUIREMENTS

Libraries required by Biblos:

OSFI >= 3.1
EOCFI >= 4.9.1 cpp x64
boost >= 1.60.0
kissFFT >= 1.30 with headers installed in <kiss_installation_directory>/include/kiss_fft
netcdf >= 4.4.0
zlib >= 1.2.8
hdf5 >= 1.8.16
Eigen >= 3.2.8

Tools:

GCC toolchain >= 4.9
cmake >= 2.8.12
make

Libraries websites, which are required by Biblos, are listed in <https://gmv-biblos.gmv.com/step-by-step-guide-2/links-to-external-libraries/>.

8.1.1. BLOCKS REQUIREMENTS

These requirements applies for :

Biblos.Orbit, Biblos.Attitude, Biblos.AOCSInstrumentCoupling, Biblos.SceneInteraction,
Biblos.Resampling, Biblos.Atmosphere, Biblos.Spatial and Biblos.Radiometric blocks

REQUIRED LIBRARIES:

Biblos.Commons >= 1.0

8.1.2. MODULES REQUIREMENTS

These requirements applies for :

Biblos.SceneGeneration, Biblos.Geometry and Biblos.Instrument

REQUIRED LIBRARIES:

Biblos.Commons >= 1.0

8.1.3. BIBLOS.GEOMETRY REQUIREMENTS

REQUIRED LIBRARIES:

BIBLOS

© GMV, 2014; all rights reserved

BIBLOS User Manual

- Biblos.Attitude >= 1.0
- Biblos.Orbit >= 1.0
- Biblos.AocsInstrumentCoupling >= 1.0
- Biblos.SceneInteraction >= 1.0

8.1.4. BIBLOS.SCENEGENERATOR REQUIREMENTS

- Biblos.Atmosphere >= 1.0
- Biblos.Resampling >= 1.0

8.1.5. BIBLOS.INSTRUMENT REQUIREMENTS

- Biblos.Spatial >= 1.0
- Biblos.Radiometric >= 1.0

8.2. FLAGS FOR BIBLOS INSTALLATION CMAKE

Recommended is installing all Biblos packages in one directory, e.g. /usr/local/biblos

Note that required COTS (Commercial Off the Shelf) libraries with installation script are available in Biblos.COTS package:

<https://gmv-biblos.gmv.com/download/biblos-cots/> (see. 8.3).

If user decide to install all the Biblos packages in one directory, only REQUIRED flags should be provided.

REQUIRED:

```
pass Biblos block installation directory - here /usr/local/biblos : flag CMAKE_INSTALL_PREFIX
pass osfi intallation directory - here /usr/local/openSF/OSFI : flag OSFI_INST_PATH
pass EOCFI installation directory - here /usr/local/EOCFI : flag EOCFI_INST_PATH
pass parent kissFFT installation directory - here /usr/local/biblos_cots/ : flag KISS_FFT_INST_PATH
pass parent netCDF installation directory - here /usr/local/biblos_cots/ : flag NETCDF_INST_PATH
pass parent Eigen installation directory - here /usr/local/biblos_cots/ : flag EIGEN_INST_PATH
pass parent Boost installation directory - here /usr/local/biblos_cots/ : flag BOOST_INST_PATH
```

NOT REQUIRED:

-DNO_ORB=1	do not compile orbit block
-DNO_ATT=1	do not compile attitude block
-DNO_AOC=1	do not compile aocs instrument coupling block
-DNO_SCE=1	do not compile scene interaction block
-DNO_ATM=1	do not compile atmospheric block
-DNO_RES=1	do not compile resampling blockq
-DNO_SPA=1	do not compile spatial block
-DNO_RAD=1	do not compile radiometric block
-DNO_GMOD=1	do not compile geometry module
-DNO_SMOD=1	do not compile scene generation module

-DNO_IMOD=1 do not compile instrument module

if you install all Biblos blocks in one directory these cmake FLAGS are NOT REQUIRED:

-DBIBLOS_INST_PATH=path	biblos library installation directory path
in case they were installed in different directory	
-DBIBLOS_COMMONS_INST_PATH=path	installation directory path of the biblos commons library in case the commons library was installed in different directory
-DBIBLOS_ORBIT_INST_PATH=path	installation directory path of the biblos orbit block library in case the block was installed in different directory
-DBIBLOS_ATTITUDE_INST_PATH=path	installation directory path of the biblos attitude block library in case the block was installed in different directory
-DBIBLOS_AOCS_INST_PATH=path	installation directory path of the biblos aoocs instrument coupling block library in case the block was installed in different directory
-DBIBLOS_SCENE_INTERACTION_INST_PATH=path	installation directory path of the biblos scene interaction block library in case the block was installed in different directory
-DBIBLOS_ATMOSPHERE_INST_PATH=path	installation directory path of the biblos atmosphere block library in case the block was installed in different directory
-DBIBLOS_RESAMPLING_INST_PATH=path	installation directory path of the biblos resampling block library in case the block was installed in different directory
-DBIBLOS_SPATIAL_INST_PATH=path	installation directory path of the biblos spatial block library in case the block was installed in different directory
-DBIBLOS_RADIOMETRIC_INST_PATH=path	installation directory path of the biblos radiometric block library in case the block was installed in different directory

8.3. BIBLOS.COTS

Biblos.COTS is a package containing libraries used by Biblos libraries. Note that COTS "Commercial Off the Shelf" is used to follow the naming of the "OpenSF End-to-End Simulators Delivery, Installation, Running and Implementation Guidelines" (12/09/2012). Biblos.COTS only provide external libraries that are LGPL license compliant.

8.3.1. DESCRIPTION

Biblos.COTS is a package containing the following libraries:

- boost 1.60.0
- kissFFT 1.30
- netcdf 4.4.0
- zlib 1.2.8
- hdf5 1.8.16
- Eigen 3.2.8

Biblos.COTS contains all 3rd party libraries required by Biblos except from EOCFI and OSFI libraries. Installation script is located in `biblos_cots` directory (`install_biblos_cots.sh`). It requires 1 argument, which is Biblos.COTS installation directory, e.g. (`/usr/local/biblos_cots`). Script requires root privileges. Example run command:

```
sudo sh install_biblos_cots.sh /usr/local/biblos_cots
```

8.4. TEST

All packages except Biblos.Commons contains test script and test data for running the block/module. Test script `run_test.sh` is located in `data` directory. To run the script set correct `LD_LIBRARY_PATH` and run the scripts with an argument: `-b biblos_installation_directory`, e.g

```
sh run_test.sh -b /usr/local/biblos
```

Package Biblos.POC contains single test script: test_All.sh

Possible test results:

success - OUTPUT FILES MATCH PATTERN. TEST RESULT: SUCCESS
execution failure - Error Occured. TEST RESULT: FAILURE
calculation failure - Files \$1 and \$2 are different. TEST RESULT: FAILURE

9. BIBLOS BLOCKS AND MODULES

This chapter presents Biblos blocks and modules user interface (input parameters) as well as example instructions to compile, install and run short test for each package. For step-by-step installation please refer to 10.

9.1. ORBIT BLOCK

9.1.1. CONFIGURATION

- Global configuration file name
- Local configuration file name

Note that installation packages does not contain block-specific configuration files, although each block has its own global and local configuration types and reading functions. Block configuration file can be specified based on `B_OrbitLocalConfig` and `B_OrbitGlobalConfig` structures.

9.1.2. INPUT

- Iers EOP initialization file name
- Initial state vector

9.1.3. OUTPUT

- Satellite orbit filename
- Restituted orbit filename

9.1.4. EXAMPLE COMPILE AND INSTALLATION COMMANDS

- Installation directory: `/usr/local/biblos`
- `EOCFI` is assumed to be installed in `/usr/local/EOCFI`
- `OSFI` is assumed to be installed in `/usr/local/openSF/OSFI`
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in `/usr/local/biblos_cots`

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -  
DOSFI_INST_PATH=/usr/local/openSF/OSFI -DEOCFI_INST_PATH=/usr/local/EOCFI -  
DKISS_FFT_INST_PATH=/usr/local/biblos_cots -DNETCDF_INST_PATH=/usr/local/biblos_cots -  
DBOOST_INST_PATH=/usr/local/biblos_cots -DEIGEN_INST_PATH=/usr/local/biblos_cots -  
DCMAKE_C_COMPILER=/usr/bin/gcc -DCMAKE_CXX_COMPILER=/usr/bin/g++
```

`make`

`sudo make install`

9.1.5. EXAMPLE RUN COMMAND

- Directories are relative to orbit/data directory
- Package is assumed to be installed in `/usr/local/biblos`.
- Biblos COTS are assumed to be installed in `/usr/local/biblos_cots`
- `OSFI` is assumed to be installed in `/usr/local/openSF/OSFI`
- `EOCFI` is assumed to be installed in `/usr/local/EOCFI`

```
export  
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib/:/usr/local/biblos_cots/lib64/  
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
/usr/local/biblos/bin/biblos_orbit input/B_GlobalConfig.xml,input/B_GeometryLocalConfig.xml  
input/bulletinb-283.dat,input/B_Initial_State_Vector.xml out/orbit_sat,out/orbit_rest
```

9.1.6. EXAMPLE TEST COMMAND

- Assumed current directory: orbit/data
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

```
export
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
sh run_test.sh -b /usr/local/biblos
```

9.2. ATTITUDE BLOCK

9.2.1. CONFIGURATON

- Global configuration file name
- Local configuration file name

Note that installation packages does not contain block-specific configuration files, although each block has its own global and local configuration types and reading functions. Block configuration file can be specified based on `B_AttitudeLocalConfig` and `B_AttitudeGlobalConfig` structures.

9.2.2. INPUT

- Iers EOP initialization file name
- Satellite orbit filename
- Restituted orbit filename

9.2.3. OUTPUT

- Nominal attitude file name
- Satellite attitude file name
- Restituted attitude file name

9.2.4. EXAMPLE COMPILED AND INSTALLATION COMMANDS

- Installation directory: /usr/local/biblos
- EOCFI is assumed to be installed in /usr/local/EOCFI
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in /usr/local/biblos_cots

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -
DOSFI_INST_PATH=/usr/local/openSF/OSFI -DEOCFI_INST_PATH=/usr/local/EOCFI -
DKISS_FFT_INST_PATH=/usr/local/biblos_cots -DNETCDF_INST_PATH=/usr/local/biblos_cots -
DBOOST_INST_PATH=/usr/local/biblos_cots -DEIGEN_INST_PATH=/usr/local/biblos_cots -
DCMAKE_C_COMPILER=/usr/bin/gcc -DCMAKE_CXX_COMPILER=/usr/bin/g++
```

```
make
```

```
sudo make install
```

9.2.5. EXAMPLE RUN COMMAND

- Directories are relative to attitude/data directory.
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots.
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

```
export
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
/usr/local/biblos/bin/biblos_attitude input/B_GlobalConfig.xml,input/B_GeometryLocalConfig.xml
input/bulletinb-283.dat,expected/orbit_sat,expected/orbit_rest out/att_nom,out/att_sat,out/att_rest
```

9.2.6. EXAMPLE TEST COMMAND

- Assumed current directory: attitude/data
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

```
export
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
sh run_test.sh -b /usr/local/biblos
```

9.3. AOCSINSTRUMENTCOUPLING BLOCK

9.3.1. CONFIGURATON

- Global configuration file name
- Local configuration file name

Note that installation packages does not contain block-specific configuration files, although each block has its own global and local configuration types and reading functions. Block configuration file can be specified based on B_AOCSLocalConfig and B_AOCSGlobalConfig structures.

9.3.2. INPUT

- Satellite orbit file name
- Satellite attitude file name

9.3.3. OUTPUT

- LOS (Line of sight) file name
- Rotation matrix instrument to satellite file name
- Rotation matrix : orbit to ecef file name
- Rotation matrix : instrument to ecef file name

9.3.4. EXAMPLE COMPIILATION AND INSTALLATION COMMANDS

- Installation directory: /usr/local/biblos
- EOCFI is assumed to be installed in /usr/local/EOCFI
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in /usr/local/biblos_cots

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -

expected/orbit_sat,expected/att_sat out/los,out/roti2s,out/roto2e,out/roti2e
```

9.3.6. EXAMPLE TEST COMMAND

- Assumed current directory: aocs/data
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

```
export  

LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/  

:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
sh run_test.sh -b /usr/local/biblos
```

9.4. SCENEINTERACTION BLOCK

9.4.1. CONFIGURATON

- Global configuration file name
- Local configuration file name

Note that installation packages does not contain block-specific configuration files, although each block has it's own global and local configuration types and reading functions. Block configuration file can be specified based on B_SceneLocalConfig and B_SceneGlobalConfig structures.

9.4.2. INPUT

- Iers EOP initialization file name
- Digital Elevation Model (DEM) file name
- Satellite orbit file name
- Rotation matrix : instrument to ecef file name
- LOS (Line of sight) file name

9.4.3. OUTPUT

- Geodetic file name
- OZA (Observation Zenith Angle) file name
- SZA (Solar Zenith Angle) file name
- RAA (Relative Azimuth Angle) file name

9.4.4. EXAMPLE COMPILED AND INSTALLATION COMMANDS

- Installation directory: /usr/local/biblos
- EOCFI is assumed to be installed in /usr/local/EOCFI
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in /usr/local/biblos_cots

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -  
DOSFI_INST_PATH=/usr/local/openSF/OSFI -DEOCFI_INST_PATH=/usr/local/EOCFI -

```

```
sh run_test.sh -b /usr/local/biblos
```

9.6. ATMOSPHERE BLOCK

9.6.1. CONFIGURATON

- Global configuration file name
- Local configuration file name

Note that installation packages does not contain block-specific configuration files, although each block has it's own global and local configuration types and reading functions. Block configuration file can be specified based on B_AtmoLocalConfig and B_AtmoGlobalConfig structures.

9.6.2. INPUT

- Look-Up-Tables folder with atmosphere data
- SZA (Solar Zenith Angle) file name
- OZA (Observation Zenith Angle) file name
- RAA (Relative Azimuth Angle) file name
- Geodetic file name

9.6.3. OUTPUT

- Top Of Atmosphere (TOA) file name

9.6.4. EXAMPLE COMPIILATION AND INSTALLATION COMMANDS

- Installation directory: /usr/local/biblos
- EOCFI is assumed to be installed in /usr/local/EOCFI
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in /usr/local/biblos_cots

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -

```
export
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib/:/usr/local/biblos_cots/lib64/
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
/usr/local/biblos/bin/scenegen_module
input/B_GlobalConfig.xml,input/B_SceneGenerationLocalConfig.xml
input/ref.nc,expected/geo,input/LUTS/,expected/sza,expected/oza,expected/raa out/resm,out/toa
```

9.10.6. EXAMPLE TEST COMMAND

- Assumed current directory: scene_generation_module/data
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

```
export
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib/:/usr/local/biblos_cots/lib64/
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
sh run_test.sh -b /usr/local/biblos
```

9.11. INSTRUMENT MODULE

9.11.1. CONFIGURATON

- Global configuration file name
- Local configuration file name

9.11.2. INPUT

- Modulation Transfer Function (MTF) configuration file name
- Top Of Atmosphere (TOA) file name
- Scene Irradiances

9.11.3. OUTPUT

- Scene Irradiances
- Raw data image

9.11.4. EXAMPLE COMPILE AND INSTALLATION COMMANDS

- Installation directory: /usr/local/biblos
- EOCFI is assumed to be installed in /usr/local/EOCFI
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- COTS (Boost, Eigen, KissFFT, NetCDF, ZLIB, HDF5) are assumed to be installed in /usr/local/biblos_cots
- Biblos.Spatial and Biblos.Radiometric are assumed to be installed in /usr/local/biblos

```
cmake -DCMAKE_INSTALL_PREFIX=/usr/local/biblos -DCMAKE_BUILD_TYPE=Release -  
DOSFI_INST_PATH=/usr/local/openSF/OSFI -DEOCFI_INST_PATH=/usr/local/EOCFI -  
DKISS_FFT_INST_PATH=/usr/local/biblos_cots -DNETCDF_INST_PATH=/usr/local/biblos_cots -  
DBOOST_INST_PATH=/usr/local/biblos_cots -DEIGEN_INST_PATH=/usr/local/biblos_cots -  
DCMAKE_C_COMPILER=/usr/bin/gcc -DCMAKE_CXX_COMPILER=/usr/bin/g++
```

make

sudo make install

9.11.5. EXAMPLE RUN COMMAND

- Directories are relative to instrument/data directory.
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots.
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

export

```
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/  
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
/usr/local/biblos/bin/instrument_module input/B_GlobalConfig.xml,input/B_InstrumentLocalConfig.xml  
input/MTF.xml,expected/toa out/scene_irr,out/raw_data
```

9.11.6. EXAMPLE TEST COMMAND

- Assumed current directory: instrument/data
- Package is assumed to be installed in /usr/local/biblos.
- Biblos COTS are assumed to be installed in /usr/local/biblos_cots
- OSFI is assumed to be installed in /usr/local/openSF/OSFI
- EOCFI is assumed to be installed in /usr/local/EOCFI

export

```
LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64/  
:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib/
```

```
sh run_test.sh -b /usr/local/biblos
```

10. STEP-BY-STEP INSTALLATION GUIDE

10.1. REQUIREMENTS FOR STEP-BY-STEP GUIDE

1. Operating system: OpenSUSE 13.2
2. Created user account eomodel with home directory: /home/eomodel
3. Installed openSF 3.4 with OSFI, database user: openSF, database password: openSF
Installed in /usr/local (/usr/local/openSF, /usr/local/openSF/OSFI)
4. Installed EOCFI cxx 64 bit 4.9.1, installation directory: /usr/local (/usr/local/EOCFI)
5. Installed zip, GNU m4, unzip
6. Start logged as eomodel user in /home/eomodel directory.

10.2. STEPS

10.2.1. INSTALLATION OF COTS

Action	Command
1. Visit: https://gmv-biblos.gmv.com/download/biblos-cots/ And log in: user - basic pass - basic	
2. Click on the download button and save file to /home/eomodel/biblos_cots.zip	
3. Unzip the package	unzip biblos_cots.zip
4. Go into biblos_cots directory	cd biblos_cots
5. Execute installation script	sudo sh install_biblos_cots.sh /usr/local/biblos_cots
6. Wait for the installation process to finish. Check if the last message is correct: *** FINISHED INSTALLATION OF COTS ***	
7. Go into /home/eomodel directory	cd ..

Table 10-1: Installation of COTS

10.2.2. INSTALLATION OF BIBLOS LIBRARIES

Requires previous step (see 10.2.1).

Action	Command
8. Visit : https://gmv-biblos.gmv.com/download/biblos-software/ And log in: user - basic pass - basic	
9. Click on the download button and save file to /home/eomodel/biblos_software.zip	
10. Unzip the package	unzip biblos_software.zip
11. Go into biblos_software directory	cd biblos_software

Action	Command
12. Execute installation script	sudo sh install_biblos.sh -i /usr/local/biblos
13. Provide paths for libraries: - please provide NETCDF installation directory: /usr/local/biblos_cots/ - please provide EIGEN installation directory: /usr/local/biblos_cots/ - please provide KISSFFT installation directory: /usr/local/biblos_cots/ - please provide BOOST installation directory: /usr/local/biblos_cots/	/usr/local/biblos_cots /usr/local/biblos_cots /usr/local/biblos_cots /usr/local/biblos_cots
14. Wait for the installation process to finish. Check if the last message is correct: Biblos installed successfully *** FINISHED INSTALLATION OF BIBLOS ***	
15. Export LD_LIBRARY_PATH	export LD_LIBRARY_PATH=/usr/local/openSF/OSFI/lib:/usr/local/biblos_cots/lib:/usr/local/biblos_cots/lib64:/usr/local/EOCFI/libraries/LINUX64:/usr/local/biblos/lib
16. Execute testAll script	sh testAll.sh -b /usr/local/biblos
17. Check if result is correct: OUTPUT FILES MATCH PATTERN. TEST RESULT: SUCCESS	
18. Go into /home/eemodel directory	cd ..

Table 10-2: Installation of all Biblos libraries

10.2.3. INTEGRATION OF EXAMPLE SCENARIO AND POC WITH OPENSF, RUNNING EXAMPLE AND POC IN OPENSF

Requires previous step (see. 10.2.2)

Action	Command
19. Go into biblos_software directory	cd biblos_software
20. Load database biblos_poc	mysql --user=openSF --password=openSF < biblos_poc.mysql
21. Add database to OpenSF	sudo echo "db.biblos_poc=openSF;openSF;localhost" >> /usr/local/openSF/openSF.properties

Table 10-3: Integration of POC and example scenario database with OpenSF

To run example scenario:

Action	Command
22. Run openSF	openSF

Action	Command
23. Update LD_LIBRARY_PATH: Open configuration: Add to LD_LIBRARY_PATH:	Ctrl+O :/usr/local/biblos_cots/lib:/usr/local/biblos/lib:/usr/local/EOCFI/libraries/LINUX64/:
24. Connect to biblos_poc database	Go into System->Databases Pick biblos_poc Click connect Click ok
25. Run session GSI_example	Unwind sessions Right click on GSI_example In context menu: left click Run

Table 10-4: Running example scenario in OpenSF

To run POC:

Action	Command
26. Run openSF	openSF
27. Update LD_LIBRARY_PATH: Open configuration: Add to LD_LIBRARY_PATH:	Ctrl+O :/usr/local/biblos_cots/lib:/usr/local/biblos/lib:/usr/local/EOCFI/libraries/LINUX64/:
28. Run session GSI_POC	Unwind sessions Right click on GSI_POC In context menu: left click Run

Table 10-5: Running POC in OpenSF
